Telecoms are facing a perfect storm due to increasing traffic, number and variety of devices, and complexity of services and architecture. Operators are challenged both in terms of customer experience and investments needed to secure services and network quality. We need to move not only from reactive to proactive problem resolution, but to predictive maintenance and network planning where just in time investments will be ensured.

Using machine learning and advanced analytics to correlate the relationships between different data sources from radio access network in order to detect, resolve, predict and prevent service disruptions will bring decisive competitive advantage to future operators.

Presenter/Предавач: Dr Nenad Gligorić

TagItSmart is H2020 project that has a goal to enable mass market products to join IoT world by combining functional ink technology, printed NFC, crowd sourced secure scanners and cloud based data analytics. Functional ink will be used to print QR codes with embedded ability to sense temperature, humidity, elapsed time etc. which combined with printed NFC will give not only the unique identity to each item, but also ability to understand the environment and the context of the item throughout the product lifetime. Smart phones and smart glasses based scanning, combined with appropriate incentives will facilitate involvement of consumers in the process giving them additional information and services related to the item they are using, while at the same time providing valuable information to the manufacturers about how their products are used. TagItSmart project is a part of the IoT European Platforms Initiative (IoT-EPI).
